WEN Calculator Usage Reconsideration

April 18, 2017

RMS ENERGY CONSULTING, LLC

Issue Statements

1. Whether changing the ***Marginal Supply of Water*** within the WEN calculator rises to the level of departing from the default values approved by the CPUC in D.15.09.023?

2. Whether the WEN Calculator is correctly calculating the ***Annual Embedded IOU Electric Energy Savings***?

3. Whether the use of the WEN Calculator should be reconsidered to a more simplified version of the calculator?

Changing Marginal Supply of Water

RMS ENERGY CONSULTING, LLC

CPUC Decision 15-09-023 Regarding Tools for Calculating the Embedded Energy in Water

- Energy efficiency Program Administrators shall use the Water-Energy Calculator and the Avoided Water Capacity Cost Model in preparing their requests for ratepayer funding for measures/programs that reduce water use and thus save embedded energy.

- Energy efficiency Program Administrators (PAs) ***may depart from*** the Water-Energy Calculator and the Avoided Water Capacity Cost Model (collectively, tools) ***defaults where the tools allow***. Where PAs depart from default values, they bear the burden of proving the departure(s) reasonable in all documents submitted to Commission Staff.

- When ***overriding default values*** in the Water-Energy Calculator and the Avoided Water Capacity Cost Model (collectively, tools), ***users should continue to use values for a marginal supply; rather than for historical/existing supplies***, when using the tools in connection with anything that the Commission is reviewing in a proceeding or advice letter.

In adopting the Calculator, the CPUC allowed Users to override the following variables

- Merely changing the marginal supply of water dropdown, on the input tab of the WEN Calculator, ***DOES NOT*** depart from the default values because:
  - ***All marginal supplies of water*** documented in the Navigant Report including but not limited to recycled, groundwater, brackerish desal, and seawater desal were approved by the CPUC as defaults as dropdown selections on the input tab of the WEN Calculator.
  - The default value for water supply. "This feature allows users to enter data for a variety of marginal water supply options, e.g. recycled water with or without purple pipe, desalination, etc. This will allow users to enter marginal supply options that may be most appropriate for their local circumstances. ***When overriding default values, users should continue to use values for a marginal supply; rather than for historical/existing supplies***."
  - IOUs would have to bear the burden of proving the departure from default values when IOUs change the default supply type percentages
    - (i.e. Seawater Desal %IOU default is 94% and IOU decides to change the IOU% to 100%).
    - Ii.e. changing the energy intensity of conventional treatment from 142 kWh/AF to 300 kWh/AF)

Correctly Calculating Annual Embedded IOU Electric Energy Savings?

Issue 1: Underestimate Savings for Indoor Water Use Measures

- In adopting the Calculator, the CPUC allowed Users to override the resource balance year (e.g. 2016).
  - *"2016 is a reasonable choice for the resources balance year as water agencies and utilities are currently facing choices about where and how they will produce water supply."*

- The WEN Calculator ***incorrectly uses Historical Supply Information*** to calculate Annual Embedded IOU Electric Energy Savings ***because it pulls in the wrong Resource balance year*** (e.g. 2014 instead of 2016).

Issue 1: Underestimates Savings for Indoor Water Use Measures

- Incorrectly uses Historical Supply Information to calculate Annual Embedded IOU Electric Energy Savings for ***Indoor Water Use Measures because it pulls in the wrong Resource balance year.***
  - Input tab shows installation year: 2016
  - WEN Calculator pulls historical supply information assuming the installation year is ***before*** 2016 (pulls 2014 data instead of 2016).
  - Resulting in ***lower*** Annual Embedded IOU Electric Energy savings because the WEN Calculator is pulling the historical average energy intensities (EI) and not the marginal electric EI by measure intensities.

Issue 1: Underestimates Savings for Indoor Water Use Measures

Resource Balance Year should be 2016 per the formula

However, based on the final output, the WEN calculator is pulling from the historical supply of 760 and not 1,049 kWh/AF.

Calculator should be pulling 2016 data instead because the resource balance years is 2016 and not 2014

When calculating embedded energy savings, the WEN Calculator should only use water savings profiles when the resource balance year is 2014 or 2015.

However, despite an install year of 2016, the formulas used to estimate embedded energy incorrectly includes the water savings profile.

Average: 1.55 Count: 12 Sum: 18.65

WEN Calculator sums up the monthly average embedded electrical energy for the wrong resource balance year (2014 instead of 2016)

The sum matches the output values shown in slides 10 and 12.

The WEN should be summing 2016 monthly Electric Energy Savings data not summing 2014 Electric Energy Savings data as shown here.

Issue 1: Underestimates Savings for Indoor Water Use Measures

- Embedded Energy Savings (kWh) for **Indoor Urban High Efficiency Toilets** using Recycled Water (RW) Marginal Supply
  - 8,000 gallons saved*
  - (1/325,851 AF/gallon) *
  - 8.3% constant load profile (2014 data)*
  - 760 kWh/AF (2014 Monthly Energy Intensity data)*
  - 12 Months

END RESULT = 18.6 kWh Annual Embedded Energy Savings

(same as output on the Navigant Report and output on the WEN Calculator)

Theoretical Calculations for Annual IOU Embedded Electric Energy

- Embedded Energy Savings (kWh) =

- Gallons saved *
- conversion from gallons to Acre Feet *
- Marginal Supply Energy Intensity (kWh/AF)

Sample Calculation Annual IOU Embedded Electric Energy for High Efficiency Toilet

- Embedded Energy Savings (kWh) =

- 8,000 Gallons saved *(1 AF/325,851 gallons)* 1,049 kWh/AF
(Marginal Supply EI of Recycled Water for North Coast Hydro Region)

- **25.7 kWh** Annual IOU Embedded Electric Energy Savings

- **The WEN Calculator is reporting 18.6 kWh** based on incorrect assumptions including resource balance year, average energy intensities and water savings profiles not applicable to the calculation.

- The WEN Calculator is not correctly calculating the embedded savings because it is pulling the average energy intensities and not the marginal electric EI by measure intensities due to the incorrect resource balance year.

Overestimates Savings for Outdoor Water Use Measures

RMS ENERGY CONSULTING, LLC

Issue 2: Overestimates Savings for Outdoor Water Use Measures

- Embedded Energy Savings (kWh) for **Outdoor Irrigation Soil Moisture Sensor (each; < 1 acre)** using Recycled Water (RW) Marginal Supply and **Conventional Treatment** for RW
  - 13,490 gallons saved*
  - (1/325,851 AF/gallon) *
  - [irrigation load profile changes based on month (2014 data)]*
  - **354** kWh/AF (2014 Monthly Energy Intensity data for North Coast)

END RESULT =
0.47+0.36+0.61+1.28+1.76+1.97+2.12+1.88+1.68+1.3+0.96+0.26 kWh

END RESULT = 14.66 kWh Annual Embedded Energy Savings

AC Water Capacity | AC WW Capacity | Env Benefits | Marg Elec EI by Measure | All EI | Monthly Water Svgs | Env Ben | Wat

Ready Average: 460 Sum: 1,379 68%

The correct sum of outdoor EI's = Extraction and Conveyance, Treatment and Distribution should be 1,379 kWh/AF (0+1,225+153) for Membrane Treatment.

Sample Calculation Annual IOU Embedded Electric Energy for Soil Moisture Sensor (each; < 1 acre)

- Embedded Energy Savings (kWh) =

- 13,490 Gallons saved *(1 AF/325,851 gallons)* 1,379 kWh/AF (Marginal Supply EI of **Recycled Water** for North Coast Hydro Region)

- **57.08 kWh** Annual IOU Embedded Electric Energy Savings

- **The WEN Calculator is reporting 20.86 kWh** based on incorrect assumptions including resource balance year, average energy intensities and water savings profiles not applicable to the calculation.

- The WEN Calculator is not correctly calculating the embedded savings because it is pulling the average energy intensities and not the marginal electric EI by measure intensities due to the incorrect resource balance year.

Non-IOU Energy Intensities for 2 Hydro Zones Appear Significantly High

RMS ENERGY CONSULTING, LLC

Issue 4: Non-IOU Energy Intensities for 2 Hydro Zones Appear Significantly High

56	CR	2014	Urban	Indoor	Non-IOU	-	-	4	17	0	-	8	-	63	13	104

Hydro Zones SC and SL have significantly higher kWh/AF Energy Intensities compared to the other 8 hydro zones

Issue 4: Non-IOU Energy Intensities for 2 Hydro Zones Appear Significantly High

1

Average Embedded Energy and Avoided Cost of Embedded Energy

Note: all metrics are on a per unit basis (Example: per low-flow shower head)

Measure ID#	Measure Name	Average Annual Embedded IOU Electric Energy (kWh)	Average Annual Embedded Non-IOU Electric Energy (kWh)	Average Annual Embedded Gas Energy (therms)	Avoided IOU Electric Energy Cost (2014$)	Avoided Gas Energy Cost (2014$)
1	High Efficiency Toilets	18.65	1.38	-	$31.49	$ -
2	High Efficiency Toilets	21.70	5.58	-	$35.86	$ -
3	High Efficiency Toilets	20.60	6.28	-	$31.49	$ -
4	High Efficiency Toilets	20.76	37.06	-	$31.49	$ -
5	High Efficiency Toilets	15.38	1.16	-	$27.38	$ -
6	High Efficiency Toilets	15.82	1.73	-	$27.38	$ -
7	High Efficiency Toilets	15.97	4.09	-	$27.38	$ -
8	High Efficiency Toilets	16.54	1.16	-	$27.38	$ -
9	High Efficiency Toilets	19.67	15.15	-	$31.49	$ -
10	High Efficiency Toilets	14.98	2.55	-	$27.38	$ -

Significantly Higher Energy Intensities for Hydro Zones SC and SL compared to the other 8 hydro zones regardless of marginal supply results in **HIGHER** Annual Embedded **Non-IOU** Electric Energy Savings (kWh) **BUT NOT HIGHER** Annual Embedded **IOU** Electric Energy Savings (kWh).
That doesn't seem right.

Changing Marginal Supply Changes Avoided Costs but not Embedded Energy Savings

RMS ENERGY CONSULTING, LLC

Issue 5: Changing Marginal Supply Changes Avoided Costs but not Embedded Energy Savings

Notice here, changing the Marginal Supply from the default of Recycled Water to Groundwater **ONLY Increased** Avoided Costs **BUT NOT** Embedded Energy Savings

Should WEN Calculator be reconsidered and simplified?

RMS ENERGY CONSULTING, LLC

Recommendations and Rationale

1. WEN Calculator should be reconsidered as the tool to calculate embedded energy savings because the tool

- **underestimates savings for Indoor Water Use Measures** by not accurately calculating savings based on incorrect assumptions including resource balance year, average energy intensities and water savings profiles not applicable to the calculation;
- **overestimates savings for Outdoor Water Use Measures** by including conventional tertiary treatment as part of potable treatment for recycled water resulting in overestimated EI's for outdoor use measures;
- **underestimates savings when Changing Treatment from Conventional to Membrane** based on incorrect assumptions including resource balance year, average energy intensities and water savings profiles not applicable to the calculation;
- appears to calculate higher energy intensities for hydro zones SC and SL regardless of marginal supply resulting in **HIGHER** Annual Embedded for **Non-IOU** Electric Energy Savings (kWh) **BUT NOT HIGHER** Annual Embedded **IOU** Electric Energy Savings (kWh); and
- is calculating **INCREASES** in Avoided Costs **BUT NOT** Embedded Energy Savings when changing marginal supplies.

Recommendations and Rationale

1. A simplified version of the tool can be used based on the CPUC approved energy intensity defaults for each marginal supply only

2. Historical data should not be used anywhere in the calculation as described in D.15.09.023.

3. The WEN Calculator calculates cost-effectiveness and avoided costs that
   - is not well understood;
   - not easily implementable into the CET; and
   - poses unnecessary redundancies in avoided cost and TRC calculations.
